

Production of Snake DAT101

Group: Håvard Øverland Hoem, Thomas Myren, Jonas Skram Rustad

Roles: Two worked primarily on the actual coding and development while one had more of a playtest/bug finding role, however there was a lot of overlap here and group coding.

AI: We did not use AI, and inline suggestions were turned off in VSCode. The reason for this was that we felt it often just messed things up and would change things we didn't intend. Therefore, we just dropped it entirely. We also felt we could do it ourselves.

Comments: Comments explaining our code were added on all aspects of the program that we created ourselves, or where we changed/tweaked the original program.

Development order:

1. Growing snake and moving apple. Most important features, there is no game if these don't work.
2. Start and pause button. Start button is easy to test and pause-function felt important.
3. The rest of the menu.
4. Scoring system, including bait value sinking after time not eaten.
5. Bug fixes.
